

QUESTION #1

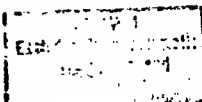

When comparing network message volumes during the past four months (November 1969 through February 1970) with those of the preceding four months (July through October 1969), an overall reduction of about 16% is noted. Specifically, CIA volumes were down nearly 14%,

25X1

The seasonal trends in both 1968 and 1969, however, exhibit an average 6% overall reduction during the same two four-month periods. Assuming that the seasonal trend continued in 1970, the actual effect of the Under Secretaries Committee's directive has been to achieve about a 10% overall reduction. The attached chart shows the volumes in the past years and FY-1970 through March 1970.

As an estimate of the future trends, since no significant change is planned during the program period in either the number of overseas field stations or the hours of communications coverage required, it is not anticipated that the overall message volumes will decrease. In addition, the centralization in Washington of operational and executive control functions will probably cause traffic volumes to surpass previous levels, over the longer term.
